Light Touch by LightBlue Optics

The following information comes from: <http://lightblueoptics.com/products/light-touch/>

"Light Touch™ is an interactive projector that instantly transforms any flat surface into a touch screen. It frees multimedia content from the confines of the small screen, allowing users to interact with that content just as they do on their hand held devices – using multi-touch technology.

Light Touch™ has [Holographic Laser Projection](#) (HLP™) technology inside which creates bright, high-quality video images in WVGA resolution. Integrated infrared sensors detect motion and turn the projected image into a 10.1" virtual touch screen, so the user can control the projector and interact with applications simply by touching the image.

The opportunities for Light Touch™ extend beyond consumer electronics and into retail spaces, the workplace and the home profoundly changing the way people interact with multimedia content and the built environment. Light Touch™ has recently been named a [CES Innovations Honoree](#) in both the Media Player and Personal Electronics categories.

Light Touch™ is a reference product, available to key customers and partners. For more information, [please contact us directly.](#)" -LightBlueOptics
