

## Pick of the Month – March 2009

### AT Pick:

#### MyTobii P10

MyTobii P10 is a portable eye-controlled communication device. Everything, including a 15” screen, eye control device and computer, is integrated into one unit. Just connect to a power source, such as a wall socket, power wheelchair or separate battery. The device can be mounted for use at a desk, on a wheelchair, in bed or anywhere suitable for the user.

With powerful, state-of-the-art features, MyTobii brings eye control to a whole new audience of users. The interface can be configured for many different skill levels thus being flexible enough to serve many different user groups.

The eye tracker doesn't need the user to “do” or “wear” anything. Simply sit in front of it, follow a dot during a 10-second calibration and you are on your way! With flexible mounting, easy customization and different hardware options, every situation is catered to.

MyTobii can be relied upon to keep working. MyTobii will operate accurately regardless of glasses, contacts, and eye color or light conditions. With MyTobii, those with uncontrolled head movements can use eye control for the first time. Tobii's unique ability to deal with large head movements opens up eye control to user groups who have been unable to use other systems.

Tobii Technology's world-leading eye tracking techniques and an integrated, tough design make the MyTobii eye tracking system extremely accurate, portable and tough enough to deal with real-life. No fragile external cameras or lighting units mean your system will be able to go everywhere with you. High accuracy and powerful interaction techniques mean MyTobii will also keep up with you.

The above information and more about the MyTobii P10 can be found at:
